Contents

This manual is for guidance on the use of the Carbolite Gero product specified on the front cover. This manual should be read thoroughly before unpacking and using the furnace or oven. The model details and serial number are shown on the back of this manual. Use the product for the purpose for which it is intended.

1.0 2416 Controller

1.1 Description

This manual applies to the 2416, 2416CG and 2416P8 controllers. Special customer requirements may result in changes to the available parameters and the navigation diagram. It is not possible to list all the possibilities in this manual.

2416CG Controller

The Eurotherm model 2416CG is a digital instrument with PID control algorithms which may be used as a simple controller or an 8-segment programmer. The 2416P8 is an eight-program model in which the programs can be stored independently or can be linked by a "call" parameter to form a single long program.

The 2416 Controller features:

- Easy use as a simple temperature controller, where on setting the required temperature the controller immediately attempts to reach and maintain it. Fig.1 indicates the type of temperature response when used in this way.
- By using one program segment, the control can be extended to include ramp-to-set-point. Fig.2 shows the effect.
- Alternatively, the 2416 Controller may be used as an 8-segment programmer, with each segment being a "Ramp", a "Step", a "Dwell", or "End". The program can be set to cycle if required. See fig. 3.
- Optional “modules” are available, in particular:
  - RS232 and RS432/485 digital communications modules;
  - Analogue communication modules;
  - “PDSIO” modules for communication with other controllers of similar or higher specification, for example, to allow cascade control;
  - Alarm modules, which can be used to drive visible or audible alarms, or to provide volt-free contacts for customer use.
1.2 Operation

Most Carbolite Gero products are fitted with an instrument switch which cuts off power to the controller and other parts of the control circuit. See section 1.0 for operating instructions.

To operate the 2416 Controller there must be power to the furnace or oven and the instrument switch must be on. If a time switch is included in the furnace or oven circuit, this must be in an ON position.

2416CG - Operation

When switched on, the controller lights up, goes through a short test routine and then displays the measured temperature and setpoint. Depending on its state when it was last switched off, it may start to control to the current setpoint of program. The output light glows or flashes to indicate that the control is occurring.

The buttons and indicators are used for the following purposes:

<table>
<thead>
<tr>
<th>Auto/Manual</th>
<th>Disabled.</th>
<th>The unit is always in 'Auto' mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>RUN/HOLD</td>
<td>-</td>
<td>Used to start, stop or pause a program. Short presses cause it to alternate between 'Run' and 'Hold', but if it is held for 2 seconds the programmer goes into 'Reset' mode where it behaves as a simple controller.</td>
</tr>
<tr>
<td>Up + Down</td>
<td>▲ + ▼</td>
<td>To adjust the value of a parameter. Used to change the setpoint when the unit is being used as a simple controller ('Reset' mode). Holding down gives an accelerated parameter change.</td>
</tr>
<tr>
<td>Page</td>
<td>📖</td>
<td>Allows access to the parameters within the controller; most lists and parameters are hidden from the operator as they contain factory-set values which should not be altered. A single press of the page key shows the temperature units,</td>
</tr>
</tbody>
</table>
normally °C; further presses reveal the lists indicated in the Navigation Diagram.

Scroll

Allows access to the parameters within a list. A single press displays the temperature units; further presses reveal the parameters in the current list. Some parameters are display-only, others may be altered by the operator.

Page + Scroll

Press together to cause an immediate return to the 'Home List'

Run & Hold

Indicate the current mode: 'Run', 'Hold', or 'Reset' (Reset: both lights off).
'Run' flashes at the end of a program.
'Hold' flashes during holdback (when the program is paused to allow the temperature to catch up with a heating or cooling rate which is too fast).

Output Indicator

OP1 indicates that the programmer is calling for heat to be supplied.
OP2 is not used.

SP2 and REM

Not generally used; indicate 'Second' or 'Remote' setpoint in use.

**Operation as a Simple Controller**

Press RUN/HOLD for 2 seconds to go into 'Reset' mode. Use down ▼ or up ▲ from the 'Home List' (i.e. when the temperature is displayed) to adjust the setpoint. The unit starts to control in the way indicated in Fig. 1.

Note that to use the Ramp Rate feature, as in Fig. 2, it is necessary to create a program. See the following sections.

**1.3 Programming**

Note that a currently active segment cannot be altered - put the programmer into 'Hold' or 'Reset' whenever it is necessary to do so to alter a parameter. Go into 'Reset' mode (i.e. press RUN/HOLD for 2 seconds) before starting to create or modify a program.

Press page ▲ until 'ProG LiSt' is displayed.

Press scroll ▼ to reveal the 'Holdback' and 'Loop Count' parameters. See sections 1.3.3 and 1.3.4 for a description of these.

Press scroll ▼ to display 'SEG.n' (segment number); use down ▼ or up ▲ to move to the segment to be adjusted or created.

Press scroll ▼ to see the 'TYPE' (segment type); use down ▼ or up ▲ to change the required segment type – see the table below.
Press scroll to access the parameters appropriate to the type of segment chosen – see the following table – and use down or up to alter the values. The final segment should be of type 'End', unless all program segments are used. Segments after 'End' are ignored.

<table>
<thead>
<tr>
<th>Segment Type</th>
<th>Parameter</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>RmP.r</td>
<td>TGt</td>
<td>The target setpoint for this segment</td>
</tr>
<tr>
<td></td>
<td>rATE</td>
<td>The ramp rate (rate of temperature change) in °/ minute</td>
</tr>
<tr>
<td>RmP.t</td>
<td>TGt</td>
<td>The target setpoint for this segment</td>
</tr>
<tr>
<td></td>
<td>dur</td>
<td>The duration of the segment. The controller calculates the rate of temperature rise necessary to achieve this duration.</td>
</tr>
<tr>
<td>Dwel</td>
<td>dur</td>
<td>The time in minutes to remain at the previous target temperature. 10ths of a minutes are allowed.</td>
</tr>
<tr>
<td>SteP</td>
<td>tGt</td>
<td>A new target temperature to be achieved as quickly as possible.</td>
</tr>
<tr>
<td>CaLL</td>
<td>PrG.n</td>
<td>Only applicable to 2416P8. Calls another stored program given by 'PrG.n' as a subroutine, running it the number of times given by 'cyc.n'.</td>
</tr>
<tr>
<td></td>
<td>cyc.n</td>
<td></td>
</tr>
<tr>
<td>End</td>
<td>End.t</td>
<td>'Dwel' holds the temperature at the last target value. 'RSET' returns to simple controller operation; if the setpoint is set to zero then this effectively turns the heating off. 'SoP' sets the power to 0% – use of this is not recommended.</td>
</tr>
</tbody>
</table>

1.3.1 Programming Tips

Make sure the basic setpoint is set to zero to avoid unexpected heating at the end of a program.

If all segments are used so that there is no 'End' segment, then on completion the program automatically goes into 'Dwell'.

Dwell segments of length zero can be included. This is a way of allowing space for future program changes.

For an example of program creation, see section 1.3.6.

1.3.2 Multi-program model (2416P8)

The 'Program Edit' list contains the extra parameter 'PrG.n' and the 'Run' list contains the extra parameter 'PrG'. These features allow selection of the program to be edited or to be operated.

The extra segment type 'cALL' allows one program to call another as a subroutine; use this feature to create one or more long programs.

1.3.3 Holdback

"Holdback' can be used to prevent the program from operating ahead of the actual heating or cooling.
In the program list, scroll \( \text{arrow} \) to the 'Holdback' parameter and use down \( \text{arrow} \) or up \( \text{arrow} \) to set the holdback type as follows:

<table>
<thead>
<tr>
<th>Band</th>
<th>Holdback applies to both heating and cooling</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lo</td>
<td>Holdback applies to heating only</td>
</tr>
<tr>
<td>Hi</td>
<td>Holdback applies to cooling only</td>
</tr>
<tr>
<td>Off</td>
<td>Holdback is off</td>
</tr>
</tbody>
</table>

Set 'Hb.V' to the value in °C beyond which holdback is to operate. Type 'BAnd' and a value of 10 °C is often a suitable combination, if holdback is required. In this case, if the actual temperature deviates outside ±10 °C from the working setpoint, the holdback lamp of the front of the controller flashes and the program is held up until the temperature comes within range again.

The standard setting for holdback is OFF.

1.3.4 Program Cycling

The 'Loop Count' parameter 'CYC.n' can be set to control the number of times the program is run.

If 'CYC.n' = 1, the program stops at the end segment.

If 'CYC.n' = 5 (for example), the program runs 5 times: at the 'End' segment it returns to segment 1, until the 5th time through when it stops.

If 'CYC.n' = cont, the program never ends: it cycles continuously.

1.3.5 Running a Program

Press Run/ Hold to light up the 'Run' light. The program starts to operate.

To view the progress of a program from the 'Home' list, press scroll \( \text{arrow} \) to reveal the current segment ('SEG') and the total program time remaining in hours ('PrG.t').

For a more detailed view, press page \( \text{arrow} \) to access the 'Run' list page and scroll \( \text{arrow} \) to see its contents as shown in the Navigation Diagram below. Provided the unit is first put into 'Hold' mode, temporary changes may be made to parameters; these apply only until the program ends or is reset.

To pause a program, press Run/ Hold; the 'Hold' light comes on. To terminate a program, press Run/ Hold for 2 seconds; the 'Run' and 'Hold' lights go out.

While the program is operating, the working setpoint is shown in the lower display.

1.3.6 Program example

The following sequence of entries creates and runs the program.

1. Press page \( \text{arrow} \) key until 'ProG LiSt' is displayed.
2. Press scroll \( \text{arrow} \) until 'CYC.n' is displayed and use the arrow key to select 1.
3. Press scroll \( \text{arrow} \) until 'SEG.n' is displayed and use the arrow key to select 1.
4. Press scroll \( \text{arrow} \) until 'tYPE' is displayed and use the arrow key to select rmP.r.
5. Press scroll until 'tGt' is displayed and use the arrow key to select 600.
6. Press scroll until 'rAtE' is displayed and use the arrow key to select 5.0.
7. Press scroll until 'SEG.n' is displayed and use the arrow key to select 2.
8. Press scroll until 'tYPE' is displayed and use the arrow key to select dwEl.
9. Press scroll until 'dur' is displayed and use the arrow key to select 60.0.
10. Press scroll until 'SEG.n' is displayed and use the arrow key to select 3.
11. Press scroll until 'tYPE' is displayed and use the arrow key to select rmP.t.
12. Press scroll until 'tGt' is displayed and use the arrow key to select 400.
13. Press scroll until 'dur' is displayed and use the arrow key to select 60.0.
14. Press scroll until 'SEG.n' is displayed and use the arrow key to select 4.
15. Press scroll until 'tYPE' is displayed and use the arrow key to select 'dwEll'.
16. Press scroll until 'dur' is displayed and use the arrow key to select 30.
17. Press scroll until 'SEG.n' is displayed and use the arrow key to select 5.
18. Press scroll until 'tYPE' is displayed and use the arrow key to select rmP.r.
19. Press scroll until 'tGt' is displayed and use the arrow key to select 30.
20. Press scroll until 'rAtE' is displayed and use the arrow key to select 5.0.
21. Press scroll until 'SEG.n' is displayed and use the arrow key to select 6.
22. Press scroll until 'tYPE' is displayed and use the arrow key to select 'End'.
23. Press scroll until 'End.t' is displayed and use the arrow key to select 'dwEll'.
24. Press the page \[\text{key}\] until you return to the main display.
25. Press the 'Run' key. The program operates.

1.4 Controller Options

As options can be ordered in a variety of combinations and for a variety of purposes, exact instructions are not given here. The full Eurotherm manual may be required to determine customer parameter settings. To reveal or hide parameters in the controllers it is necessary to go into configuration mode, a security code is needed. Please consult Carbolite Gero.

1.4.1 Digital Communications - RS232

If the RS232 option is supplied, the furnace is fitted with one sub-miniature D-socket connected to the controller comms module. RS232 is suitable for direct connection to a personal computer (PC) using a "straight through" cable as follows (the linked pins at the computer end are recommended but may not be necessary). The cable is usually 9-pin at the furnace end and 9-pin at the computer, but other alternatives are shown in parentheses.
1.4.2 Digital Communications - RS485

If an RS485 option is supplied, the furnace is fitted with two D-sockets. Connection between products is by “straight” cable as follows:

<table>
<thead>
<tr>
<th>Product end of cable</th>
<th>RS485 Cable: product to PC</th>
<th>Computer end of cable</th>
</tr>
</thead>
<tbody>
<tr>
<td>female (25-pin) 9-pin</td>
<td></td>
<td>9-pin (25-pin) female</td>
</tr>
<tr>
<td>Rx</td>
<td>(2) 3</td>
<td>3</td>
</tr>
<tr>
<td>Tx</td>
<td>(3) 2</td>
<td>2</td>
</tr>
<tr>
<td>Com</td>
<td>(7) 5</td>
<td>5</td>
</tr>
</tbody>
</table>

1.4.3 Comms Address

Typically the comms address is set to 1, but this can be changed. In the case of RS485 and multiple instruments it is necessary to set different addresses. To change the address value, access the level 2 list. In level 2 press the page key until the COMMS parameter is displayed. Press up ▲ down ▼ to select the address value.

1.4.4 Alarm Option

When an alarm board is fitted, which consists of a relay with voltage free contacts, for operator use, the contacts are taken to a panel plug on the control panel, wired as indicated:
The purpose of the 2 amp fuse is to break the circuit to prevent overloading on the circuit due to high voltage.

The instrument configuration and parameters available to the operator depend on the customer requirements.

### 1.5 Temperature Controller Replacement

Before handling the controller: wear an anti-static wrist strap or otherwise avoid any possibility of damage to the unit by static electricity. Refer to the detailed instructions supplied with the replacement controller.

Ease apart the two lugs at the side; grip the instrument and withdraw it from its sleeve; push in the replacement.
