Contents
This manual is for guidance on the use of the Carbolite Gero product specified on the front cover. This manual should be read thoroughly before unpacking and using the furnace or oven. The model details and serial number are shown on the back of this manual. Use the product for the purpose for which it is intended.

1.0 Warnings

1.1 General Warnings

DANGER – Electric shock. Read any warning printed next to this symbol.
WARNING: Risk of fatal injury.

DANGER – Hot surface. Read any warning printed next to this symbol.
WARNING: All surfaces of a product may be hot.

DANGER – Read any warning printed next to this symbol.

Caution – Double Pole/Neutral Fusing
2.0 Installation

2.1 Unpacking and Handling

When unpacking and handling the product, always lift it by its base. Do not use the door or any other projecting cover or component to support the equipment when moving it. Use two or more people to carry the product where possible.

Carefully remove any packing material from inside and around the product before use. Avoid damaging the surrounding insulation when removing packing materials.

NOTE: This product contains Refractory Ceramic Fibre (also known as Alumino Silicate Wool - ASW). For precautions and advice on handling this material see section 8.2.

2.2 Siting and Setting Up

Place the product on a level surface in a well ventilated area.

Site away from other sources of heat and on a non-flammable surface that is resistant to accidental spillage or hot materials.

The surface on which the equipment is mounted should be stable and not subject to movement or vibrations.

The height of the mounting surface is important to avoid operator strain when loading and unloading samples.

Unless otherwise stated elsewhere in this manual, ensure that there is at least **150 mm** of free space around the back and sides of the product. Clear space is required above the product to dissipate heat.
Ensure that the product is placed in such a way that it can be quickly switched off or disconnected from the electrical supply.

Under no circumstances should any objects be placed on top of the product. Always ensure that any vents on the top of the product are clear of any obstruction. Always ensure all cooling vents and cooling fans (if fitted) are clear of any obstruction.

2.3 Electrical Connections

Connection by a qualified electrician is recommended.

This product requires a single-phase A.C. supply with earth (ground), which may be Live to Neutral non-reversible (polarised), Live to Neutral reversible (non-polarised), or Live to Live.

Check the product rating label before connection. The supply voltage should agree with the voltage on the label and the supply capacity should be sufficient for the current on the label. For further information, please see wiring diagram 02047-5001.

The supply should be fused at the next size equal to, or higher than the current on the label. A table of the most common fuse ratings is also given towards the back of this manual. When the mains cable is factory fitted, internal fuses are also fitted. It is essential that the operator ensures that the product is correctly fused.
2.0 Installation

Products with a factory fitted supply cable are designed to be wired directly to an isolator or fitted with a line plug.

Products without a factory fitted supply cable require a permanent connection to a fused and isolated supply. The product's electrical access panel should be temporarily removed, and connections made to the internal terminals.

If the product is to be connected by line plug. The plug should be within reach of the operator and should be easy to remove.

When connecting the product to an isolating switch ensure that both conductors (single phase) or on all live conductors (three phase), and should be within reach of the operator.

The supply MUST incorporate an earth (ground).

2.4 Gas Supply Connections

High quality bulkhead connectors are provided for the connection of suitable gas. The incoming supply piping should measure 6 mm outside diameter.

When fitting the incoming pipe refer to the following instructions, this will ensure a leak-free joint is made. The Swagelok fittings will allow disconnection and re-connection many times providing the instructions are followed.

The gas should be clean, dry and free from impurities.

Gas Supply: CO₂ Connection Pipe: ø6 mm
1. The CO₂ gas supply should be isolated and regulated above 2 bar. (Approximately 5 bar).
2. Turn on the gas supply.
3. Slowly increase the CO₂ pressure regulator until the pressure gauge reads 2 bar.
4. This may need fine adjustment when the test has started.

5. Connect glass retort to CO₂ OUT
2.0 Installation

2.5 Glass Retort Thermocouple

1. Remove front right hand side panel.

2. Un-plug the thermocouple

3. Remove the centre MI thermocouple, by turning the fixing screw out.

4. Lower the thermocouple down and through the hole in bottom mesh.
5. Fit outer glass retort into heating chamber, locating the bottom end of the smaller retort tube through the base of the heating chamber.

6. Carefully slide the thermocouple into the glass tube to the top of the sheath.
7. Pull back from the top 2mm and re-fit the fixing screw.
8. Plug back in the thermocouple.
9. Re-fit front panel.
3.0 3508 Controller

3.1 PID control
This controller uses PID (Proportional Integral Derivative) temperature control. This type of control uses a complex mathematical control system to adjust the heating power and achieve the desired temperature.

3.2 3508P1
The 3508P1 is a digital temperature controller which uses PID algorithm to give excellent temperature control when properly set. This controller can store and operate a single program of up to 20 segments. The 3508P1 can also be used as a simple temperature controller.

3.3 3508P10
The 3508P10 is a digital controller which uses PID algorithms to give excellent temperature control when properly set. This controller can store 10 programs of up to 50 segments each. Programs can be operated individually or linked by a Call parameter as sub-programs or to form single long programs. The 3508P10 can also be used as a simple temperature controller.

3.4 3508P25
The 3508P25 is a digital temperature controller which uses PID algorithms to give excellent temperature control when properly set. This controller has a maximum of 500 segments or 25 programs; each program has a maximum of 50 segments. For example 3508P25 could store 10 programs with 50 segments or 25 programs with 20 segments. Programs can be operated individually or linked by a Call parameter as sub-programs or to form single long programs. The 3508P25 can also be used as a simple temperature controller.

</table>

Pressing any other combination of keys together has no effect.

Note: If no keys are pressed for 1 minute, the display returns to Home.

3.6 Quick Start Guide

3.6.1 Operation as a simple controller

When switched on the controller goes through a short test routine and then shows the measured temperature. Below it, the setpoint temperature (SP) and percentage of power output.

The controller will immediately attempt to reach the set temperature and maintain it. This will cause the product to heat as quickly as possible which may not be appropriate where the product contains sensitive ceramic components. For products with ceramic components, e.g. a tube furnaces fitted with a long ceramic work tube, use the ramp rate feature set with a low heating rate such as 5°C per minute (300°C per hour), to prevent damage.

3.6.2 Changing the Setpoint

Press up ▲ or down ▼ to select the required SP. If the SP is higher than the measured temperature, the OP1 indicator will illuminate at the top of the display, indicating that the product is heating.

The controller will immediately attempt to reach the set temperature and maintain it.
This will cause the product to heat as quickly as possible which may not be appropriate where the product contains sensitive ceramic components. For products with ceramic components, e.g. a tube furnaces fitted with a long ceramic work tube, use the ramp rate feature set with a low heating rate such as 5°C per minute (300°C per hour), to prevent damage.

### 3.6.3 Resetting the programmer

To reset the programmer to simple controller mode, press RUN/HOLD for 2 seconds.

**Operating the current program**

- To avoid unwanted heating at the end of a program, set the SP temperature to zero before operating a program.
- Ensure the programmer is reset to simple controller mode before starting a program by pressing RUN/HOLD for 2 seconds.
- To start the program, press RUN/HOLD twice, RUN will light up on the display.

The displayed Program Setpoint (PSP) follows ramps, dwells and steps as the program runs. The SP temperature of the controller does not apply when a program is operating.

- To pause the program, press RUN/HOLD.
- To stop the program and return to simple controlling (reset), press RUN/HOLD for 2 seconds.

When the program ends, the programmer will either:

- Automatically reset to operation as a simple controller.
- Dwell at the last temperature of the program (with the RUN indicator flashing), until the operator presses RUN/HOLD for 2 seconds to manually reset, or presses RUN/HOLD once to restart the program.
- Turn power to the elements down to zero.

### 3.6.4 Understanding User Levels

There are two levels in the controller; Level 1(Operator) and Level 2 (Supervisor).

**Level 1 (Operator)** is for the day-to-day operation of the controller is not protected by a security code. There are 3 pages at this level. Page 1, Customer Identity, can only be altered in level 2. Page 2 shows the current program status. Page 3 is for writing and viewing programs.

**Level 2 (Supervisor)** requires a security code to enter, but once enable, provides access to additional parameters. A further 4 pages are accessible in this level as follows; Home, Customer identity, Control Output Hi percentage, Units.
To Enter Level 2:

1. Press and hold page ▲ for 3 seconds. The display will show “Access Goto Level 1”

2. Press up ▲ to select level 2. After a short pause the display will show “Access Pass code”.

3. Press up ▲ or down ▼ to enter the pass code. Pass is momentarily displayed. After a short pause the display will return to home, the controller is now in level 2.

When Level 2 operations have been completed the supervisor must return to Level 1 manually. It is not necessary to enter a code when going from a higher level to a lower level.

To Return to Level 1:

1. Press and hold page ▲ for 3 seconds. The display will show “Access Goto Level 2.

2. Press down ▼ to go to level 1. After a short pause the display will revert to home, the controller is now in level 1.

3.7 Setting Up Controller

Before using the controller (or during its lifetime) certain parameters may have to be set, depending on specific requirements. To do this the controller must be set to Supervisor Level 2, see "Controller Navigation Diagrams".

3.7.1 Maximum output power setting

Press page ▲ until "Control Output Hi" is displayed. Press up ▲ or down ▼ to adjust the value.

Depending on the product model, the maximum power output setting may be accessible or locked.

For silicon carbide heated products the parameter is accessible to allow compensation for element ageing.

In many models the maximum power output setting depends on the electrical supply voltage, refer to section 11.0.

3.7.2 Customer ID.

A product identity number can be entered if required. This may be used to identify one of many units, for production or quality control systems.

Press page ▲ until "Customer Identity" is displayed. Press up ▲ or down ▼ to select a number.
3.7.3 Units

Press page □ until "Units" is displayed. Press up ▲ or down ▼ to select:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>Celsius</td>
</tr>
<tr>
<td>F</td>
<td>Fahrenheit</td>
</tr>
<tr>
<td>K</td>
<td>Kelvin</td>
</tr>
</tbody>
</table>

3.7.4 Language

The text on the 3508 Controller can be shown in different languages, this can only be set at the factory and therefore must be specified at the time of placing an order.

3.8 Programming

3.8.1 Programming Notes

Programs can be created in Level 1 or Level 2 of the 3508 Controller.

For the P10 and P25, new programs can be created while the current program is operating.

To avoid unwanted heating at the end of a program, set the controller setpoint temperature to zero before operating a program.

All new unused programs show only 1 segment of type 'End'.

The minimum number of segments for a program is 2. The second being an 'End' type.

Ramp-to-setpoint control. To achieve this, create a two segment program. Set the first segment type as 'Rate' or 'Time'. Set the second segment type 'End' type' Dwell'.

For the P10 and P25, programs can be linked together using a 'Call' segment. However, a lower number program can not be called and a program can not be ended with a call segment.

A program can be ended in four ways:

1. With 'End' segment set to S.OP the power to the elements is turned down to 0%, no matter what the 'Setpoint' temperature is.
2. With 'End' segment set to 'Reset' and the 'Setpoint' temperature turned down to zero, power to the elements will be 0%. To do this set the 'Setpoint' temperature to the minimum possible. For type B thermocouples this will be below zero.
3. With the 'End' segment set to 'Reset'. The controller will try to reach and maintain the 'Setpoint' temperature in place before the program started.
4. With the 'End' segment set to 'Dwell'. The controller will dwell at the 'PSP' of the last segment ('RUN' indicator flashes), until it is reset.

To reduce the number of segments in a program, change the last required segment to an 'End' type.

You will be asked to press □ to cancel or □ for OK.

To cancel all segments in a program, change the first segment to an 'End' type.
To alter parameters or segments of an operating program, this program must be held or reset. Press RUN/ HOLD to pause the program, or press RUN/ HOLD for 2 seconds to reset.

3.8.2 Holdback

Holdback can be used to prevent the program from operating ahead of the actual heating or cooling.

The holdback value is the amount, in degrees, by which the program setpoint can run ahead of the measured temperature before holdback operates. The value applies to a whole program.

To set the value press page \(\text{Page}\) twice, press scroll \(\text{Scroll}\) until 'Holdback Value' appears and press up \(\uparrow\) or down \(\downarrow\) to set.

Holdback can be used in 'Rate', 'Time' and 'Step' segments.

- For 'Rate' and 'Time' segments holdback will operate during the segment.
- For a 'Step' segment holdback delays continuation to the next segment until the step target is reached.

The 'Holdback Type' can be set as follows:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Low</td>
<td>Applies to heating only</td>
</tr>
<tr>
<td>High</td>
<td>Applies to cooling only</td>
</tr>
<tr>
<td>Band</td>
<td>Applies to both heating and cooling</td>
</tr>
<tr>
<td>Off</td>
<td>Holdback is switched off</td>
</tr>
</tbody>
</table>

To set the holdback type, press page \(\text{Page}\) twice, then press scroll \(\text{Scroll}\) until the display shows 'Holdback Type' for each segment and press up \(\uparrow\) or down \(\downarrow\) to set.

The default setting for holdback is 'OFF'.

3.8.3 Wait Segments

Wait prevents the program proceeding to the next segment, in a similar way to holdback, until the selected 'Wait-For' parameter has been met. There are 5 'Wait For' parameters. The first 4 only work if there are configured inputs to the controller.

1. PrgIn1 Wait until Input 1 is true
2. PrgIn2 Wait until Input 2 is true
3. PrgIn 1&2 Wait until Inputs 1 AND 2 are true
4. PrgIn 1or2 Wait until Inputs 1 OR 2 is true
5. PVWaitIP Wait until the measured temperature reaches a threshold value before continuing. It can operate in one of 4 ways:
   1. 'Abs Hi' Wait until the measured temperature is greater than or equal to a value 'WaitVal' set for that segment.
   2. 'Abs Lo' Wait until the measured temperature is less than or equal to a value 'WaitVal' set for that segment.
3. ‘Dev Hi’ Wait until the measured temperature exceeds a fixed* threshold by an amount ‘WaitVal’ set for that segment.
4. ‘Dev Lo’ Wait until the measured temperature drops below a fixed* threshold by an amount ‘WaitVal’ set for that segment.

* The fixed threshold used by deviation parameters is set in the configuration level of the programmer and if required should be requested when purchasing a product from Carbolite Gero.

3.8.4 Program Cycling
The 'Cycles' parameter sets the number of times the program will operate.
The default setting is 1 cycle.

To change the number of cycles, press page twice, then press scroll until the display shows 'Prog Cycles', then press up to set a finite number of cycles up to 999. Or press down to set cycling to continuous.

3.8.5 Creating a Program

From the home display, press page three times to get to the programming page, the display will show “ProgEdit 1”.

Program number
On P10 or P25 models press up or down to select a new program number. The display will show that new programs have only one segment.

Holdback Value
Press scroll until the display shows 'Holdback Value'. If required: Press up or down to set a value. This value will be used in any segment where a 'Holdback Type' is set.

Ramp Units
These apply to Rate segments only. Press scroll until the display shows 'Ramp Units'. Press up or down to select the ramp units of degrees per Hour, Min or Sec.

Number of program cycles
Press scroll until the display shows 'Cycles'. Press up or down to select more than one cycle.

Now create all the segments for your program, finishing with an 'End' segment. When parameters for each segment have been entered the display goes to the next segment number.

Segment Type
Press scroll until the display shows 'Segment Type'. Press up or down to select 'Rate', 'Time', 'Dwell', 'Step', 'Wait', 'GoBack', 'Call' or 'End.'
3.0 3508 Controller

Holdback Type

Press scroll ▲ until the display shows 'Holdback Type'. If required, press up ▲ or down ▼ to select 'Off', 'Low', 'High' or 'Band'.

Target Setpoint (Visible only for Rate, Time and Step segments)

Press scroll ▲ until the display shows 'Target SP'. Press up ▲ or down ▼ to set a value.

Ramp Rate (Visible only for Rate segments)

Press scroll ▲ until the display shows 'Ramp Rate'. Press up ▲ or down ▼ to set the number of degrees per 'Ramp Unit' as set above.

Duration (Visible only for Time and Dwell segments)

Press scroll ▲ until the display shows 'Duration'. Press up ▲ or down ▼ to set a value.

Wait For (Visible only for Wait segments)

Press scroll ▲ until the display shows 'Wait For'. Press up ▲ or down ▼ to select: PrgIn1, PrgIn2, PrgIn1In2, PrgIn1orIn2, PVWaitIP.

GoBack to segment number (visible only for GoBack segments)

Press scroll ▲ until the display shows 'GoBack Seg'. Press down ▼ to select a segment number to go back to.

GoBack Cycles (visible only for GoBack segments)

Press scroll ▲ until the display shows 'GoBack Cycles'. Press up ▲ or down ▼ to set a value.

Call Cycles (Visible only for call segments)

Press scroll ▲ until the display shows 'Call Cycles'. Press up ▲ or down ▼ to set a value.

End Type (Visible only for End segments)

Press scroll ▲ until the display shows 'End Type'. Press up ▲ or down ▼ to select: 'Reset', 'Dwell' or 'SafeOp'.

3.8.6 Running a Program

The current program can be started from the home display by pressing RUN/HOLD or by pressing page ▼ once, then scroll ▲ once (twice for P10 and P25), then press up ▲ or down ▼ to change the status to 'Run'.

20
3.8.7 To pause (hold) a program
Press RUN/HOLD
or
Press page ⬇️ until 'Program Status Reset' appears
Press scroll ⬆️ until the cursor moves to 'Reset'
Press up ▲ or down ▼ to select 'Hold'
RUN/HLD will be displayed

3.8.8 To stop and reset a program
Press and hold RUN/HOLD
or
Press page ⬇️ until 'Program Status Reset' appears
Press scroll ⬆️ until the cursor moves to 'Reset'
Press up ▲ or down ▼ to select 'Reset'

3.8.9 To run a different program (P10 and P25)
To select a program
Press page ⬇️ until 'Program Status Reset' appears
Press scroll ⬆️ then up ▲ or down ▼ to select a program number

To operate the program
Press RUN/HOLD
or
Press scroll ⬆️ until the cursor moves to 'Reset'
Press up ▲ or down ▼ to select 'Run'
Run will be displayed

3.8.10 Program Status
While a program is operating the home display shows 3 values:
- Top: Measured temperature
- Centre: Program Setpoint (PSP)
- Bottom: Power output percentage

To see more detail:
Press page ⬇️ once to go to the program status page. The top and centre values from the home page remain on the display. The lower half of the screen now shows:
• Current program number (P10 and P25 only)
• Current segment number
• Time remaining for that segment

Further presses of the scroll key while a program is operating will reveal additional information:

- Status. This can be changed to 'Hold', 'Reset' or 'Run' by pressing up ▲ or down ▼
- Program Setpoint (PSP)
- Current Segment Type. 'Step' and 'Call' segments are instant, so are only flashed on the screen, unless holdback is operating on that segment.
- Target Setpoint
- Segment Rate For 'Rate', 'Time' and 'Step' segments only
- Cycles left
- Program Time Left

3.8.11 Program Hold with Holdback

If a holdback value has been set and the program goes into a hold state, the green HLD indicator will flash until the measured temperature catches up.

While in this condition, the program itself is put into hold by pressing the RUN/HLD button, the 'HLD' indicator will stop flashing and remain on with the 'RUN' indicator. When the program is started again by pressing the RUN/HLD button, the 'HLD' indicator will flash again if the measured temperature has not caught up with the program.

Programming note: For P10 and P25 models, other programs can be created or changed whilst the current program is operating.

3.8.12 Power Failure Recovery

If there is a power interruption to the controller during a program, when power is restored the controller pauses the program, then ramps the temperature back up to the current program setpoint (PSP) before continuing the program.

- Power failure during ramp segments: The ramp rate will be that of the current ramp segment.
- Power failure during dwell segments: The ramp rate will be that of the previous ramp segment. If a previous ramp segment does not exist, then the dwell will continue at the current measured temperature.
- Power failure during time-to-target segments: The ramp rate will be that of the current segment. The ramp rate is maintained, but the time remaining is recalculated.

If there is a power interruption while controlling to setpoint, when power is restored the controller automatically calls for maximum power.
3.8.13 Alarms

Alarms are used to alert the operator when a pre-set level has been exceeded or a function error has occurred such as a sensor break. They are indicated by a flashing red ALM (Alarm) indicator. The alarm may also switch an output – usually a relay to allow external devices to operate when an alarm occurs. Alarms only operate if they have been configured and are dependent on customer requirements.

How to acknowledge an alarm will depend on the type of latching which has been configured. A non-latched alarm will reset itself when the alarm condition is removed. A latched alarm requires acknowledgement with the 'ACK' function before it is reset.

If an alarm has been activated, the red 'ALM' indicator will flash and the text will indicate the type of alarm.

To acknowledge an alarm and cancel the 'ALM' indicator, press and together.

3.8.14 Program Example 1

The following sequence of entries creates and runs the program shown graphically below.

1. Turn the controller SP down to '0' by pressing down ▼.
2. Press page until 'Prog Segments Used' is displayed. On P10 or P25 models press up ▲ or down ▼ to select a new program number, (a program with only 1 segment).
3. Press scroll until 'Holdback Value' is displayed. Default '0' degrees.
4. Press scroll until 'Ramp Units' is displayed. Press up ▲ or down ▼ to set to 'Min'
5. Press scroll until 'Cycles' is displayed. Default '1'
6. Press scroll until 'Segment 1' is displayed
7. Press scroll until 'Segment Type' is displayed. Press up ▲ or down ▼ to select 'Rate'
8. Press scroll until 'Holdback Type' is displayed. Default 'Off'
9. Press scroll until 'Target SP' is displayed. Press up ▲ or down ▼ to set to '400' degrees.
10. Press scroll until 'Ramp Rate' is displayed. Press up ▲ or down ▼ to set to '5.0' degrees per minute.

Repeat steps 6 to 10 for 4 more segments. Set 'Holdback' to the default 'Off'. Enter the following parameters and values:

- Segment Type Dwell Duration '30:00.0' minutes
- Segment Type Step Target SP '600' degrees
- Segment Type Dwell Duration '30:00.0' minutes
- Segment Type Time Target SP '200' degrees, Duration '2:00:0' hours

Finish the program with an 'End' segment:
11. Press scroll \( \uparrow \) until 'Segment Type' is displayed. Press up \( \uparrow \) or down \( \downarrow \) to select 'End'.

12. Press scroll \( \uparrow \) until 'End Type' is displayed. Press up \( \uparrow \) or down \( \downarrow \) to select 'Reset'.

13. Press page \( \text{Page} \) and scroll \( \uparrow \) together to return to the home display.

To run the program either press RUN/HOLD or:

14. Press page \( \text{Page} \) until 'Program Status' is displayed.

15. Press scroll \( \uparrow \) until the cursor moves to the program status of 'Reset'.

16. Press \( \uparrow \) to select 'Run'.

#### 3.8.15 Program Example 2

The following sequence of entries creates and runs the program shown graphically below.

1. Turn the 'Setpoint' to '0' by pressing down ▼
2. Press page ▲ until 'Prog Segments Used' is displayed. On P10 and P25 models press up ▲ or down ▼ to select a new program number, (a program with only 1 segment).
3. Press scroll ◀ until 'Holdback Value' is displayed. Press up ▲ or down ▼ to set to '5' degrees
4. Press scroll ◀ until 'Ramp Units' is displayed. Press up ▲ or down ▼ to set to 'Min'
5. Press scroll \( \uparrow \) until 'Cycles' is displayed. Default ‘1’
6. Press scroll \( \uparrow \) until 'Segment 1' is displayed
7. Press scroll \( \uparrow \) until 'Segment Type' is displayed. Press up \( \uparrow \) or down \( \downarrow \) to select 'Time'
8. Press scroll \( \uparrow \) until 'Holdback Type' is displayed. Default ‘Off’
9. Press scroll \( \uparrow \) until 'Target SP' is displayed. Press up \( \uparrow \) or down \( \downarrow \) to set to ‘600’ degrees
10. Press scroll \( \uparrow \) until 'Duration' is displayed. Press up \( \uparrow \) or down \( \downarrow \) to set to ‘30:00.0’ minutes

Repeat steps 6 to 10 for 4 more segments. Enter the following parameters and values:
Note: Call segments are not available on single program models.

- **Segment Type Rate**: Target SP ‘400’ degrees. Ramp Rate ‘2.0’ degrees per minute
- **Segment Type Step**: Target SP ‘200’ degrees
- **Segment Type Dwell**: Holdback ‘High’. Duration ‘30:00.0’ minutes
- **Segment Type Call**: Call Prog ‘next number’. Call Cycles ‘2’

**Finish the program with an End segment:**

11. Press scroll \( \uparrow \) until 'Segment Type' is displayed. Press up \( \uparrow \) or down \( \downarrow \) to select 'End'
12. Press scroll \( \uparrow \) until 'End Type' is displayed. Press up \( \uparrow \) or down \( \downarrow \) to select 'Dwell'

Repeat the sequence to create a short program ‘3’ as suggested in the diagram.

13. Press page \( \leftarrow \) and scroll \( \uparrow \) together to return to the home display
14. Press page \( \leftarrow \) until 'Program Status' is displayed
15. Press scroll \( \uparrow \) until the cursor moves to the program status of 'Reset'
16. Press \( \uparrow \) to select 'Run'
### 3.9 Controller Options

As options can be ordered in a variety of combinations and for a variety of purposes, exact instructions are not given here. The full Eurotherm manual may be required to determine customer parameter settings. To reveal or hide parameters in the controllers it is necessary to go into configuration mode, a security code is needed. Please consult Carbolite Gero.
3.0 3508 Controller

3.9.1 Digital Communications - RS232

If the RS232 option is supplied, the furnace is fitted with one sub-miniature D-socket connected to the controller comms module. RS232 is suitable for direct connection to a personal computer (PC) using a “straight through” cable as follows (the linked pins at the computer end are recommended but may not be necessary). The cable is usually 9-pin at the furnace end and 9-pin at the computer, but other alternatives are shown in parentheses.

<table>
<thead>
<tr>
<th>Product end of cable female (25-pin) 9-pin</th>
<th>RS232 Cable: product to PC</th>
<th>Computer end of cable 9-pin (25-pin) male</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rx            (2) 3</td>
<td></td>
<td>3 (2) Tx</td>
</tr>
<tr>
<td>Tx            (3) 2</td>
<td></td>
<td>2 (3) Rx</td>
</tr>
<tr>
<td>Com           (7) 5</td>
<td></td>
<td>5 (7) Com</td>
</tr>
<tr>
<td></td>
<td></td>
<td>7,8 (4,5) Link together</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1,4,6 (6,8,20) Link together</td>
</tr>
</tbody>
</table>

3.9.2 Digital Communications - RS485

If an RS485 option is supplied, the furnace is fitted with two D-sockets. Connection between products is by “straight” cable as follows:

<table>
<thead>
<tr>
<th>Product end of cable female (25-pin) 9-pin</th>
<th>RS485 Cable: product to PC</th>
<th>Computer end of cable 9-pin (25-pin) female</th>
</tr>
</thead>
<tbody>
<tr>
<td>-            (2) 3</td>
<td></td>
<td>3 (2) Tx</td>
</tr>
<tr>
<td>+            (3) 2</td>
<td></td>
<td>2 (3) Rx</td>
</tr>
<tr>
<td>Com           (7) 5</td>
<td></td>
<td>5 (7) Com</td>
</tr>
</tbody>
</table>

3.9.3 Comms Address

Typically the comms address is set to 1, but this can be changed. In the case of RS485 and multiple instruments it is necessary to set different addresses. To change the address value, access the level 2 list. In level 2 press the page key until the COMMS parameter is displayed. Press up ▲ down ▼ to select the address value.

3.9.4 Alarm Option

When an alarm board is fitted, which consists of a relay with voltage free contacts, for operator use, the contacts are taken to a panel plug on the control panel, wired as indicated:
The purpose of the 2 amp fuse is to break the circuit to prevent overloading on the circuit due to high voltage.

The instrument configuration and parameters available to the operator depend on the customer requirements.

3.9.5 Remote Input and Output (Analogue Communications)

When analogue communications are fitted, the contacts are taken to insulated terminal sockets on the control panel.

Controller configuration depends on customer requirements.

Remote input (when specified) may be switched on and off using the remote setpoint enable parameter in the controller level 2, if this was made available for a particular application. In level 2 press page [ until ‘REM SP Enable’ is displayed, press up ▲ or down ▼ to select SP1 (the normal controller setpoint) or SP2 (the remote input setpoint), ‘SPX’ will appear in the top left corner of the display.

Remote output does not require switching on and off.

3.9.6 Program segment output

When the customer requirement is for program segment output, an extra parameter is revealed in the PROG list. For each program segment, after the segment type and settings, the parameter EVENT OUTS appears. This has values on and off. If the value
is set to on, then the relay closes during the segment and a small 1 appears in the top left of the screen.
If more than one program segment output is fitted, then there are extra boxes depending on how many event outputs there are.

3.10 Temperature Controller Replacement

Before handling the controller: wear an anti-static wrist strap or otherwise avoid any possibility of damage to the unit by static electricity. Refer to the detailed instructions supplied with the replacement controller.

Ease apart the two lugs at the side; grip the instrument and withdraw it from its sleeve; push in the replacement.

3.11 Controller Navigation Diagrams

The following diagrams detail how to navigate to the various menu options within the 3508 Controller. At each option, values can be set using the arrow keys.

Operator Level 1 - No Program Running

Hold Page Key for 3 seconds If configured

Arrow Key
4.0 3508 Dual Loop Cascade Control (if fitted)

4.1 Principle of Cascade Control

When cascade control is fitted, the Load Loop 3508 senses the temperature of the workload, and the Element Loop 3508 senses the element temperature. Depending on the oven or furnace model, the Load Thermocouple may be in a fixed position, or may be movable. The Element Thermocouple is fixed in a predetermined position near the heating elements. The Load Thermocouple should be placed as near as possible to the work to be heated.

The Load Loop communicates with the Element Loop, calling for heat according to the load temperature and the current program or set point. The Element Loop regulates the heat according to element temperature and the requests from the Load Loop.

The element temperature could, in principle, vary between the furnace or oven maximum and minimum, regardless of the working temperature of the load. In practice, the cascade control system is configured to limit the element temperature to a band around the load temperature, typically of ±10% of the set-point temperature.

The set point of the load loop, shown at the top of the display, can be adjusted by the operator. The Element Loop, shown at the bottom of the display, should not be adjusted by the operator & will automatically regulate the element temperature to achieve the Load set temperature.

In a three-zone furnace for which the “three zone cascade” option has been ordered the centre zone is a 3508 Dual Loop & separate end zone controls are fitted. The operator sets the Load loop set point on the 3508 centre zone. The end zone controllers work automatically & need no adjustment by the operator.

4.2 Operation of Cascade Control

The operator may ignore all the complications of the system, and program the Load Loop according to the standard instructions for that controller. The home display shows the load loop at the top of the display and the Element loop at the bottom. By pressing the page key, separate views of load and element loops will be shown.
The Element Loop should never be adjusted. Note that the elements usually run at a higher temperature than the load.
Because the details of the customer’s cascade application (in particular the nature of the load) are generally not known, the feed forward parameter (FF Trim) is made easily accessible in level 2 (Refer to instrument operating instructions). Its default setting is 2%. If overshoot of the load temperature occurs – often a problem at low temperatures – then FF Trim can be reduced in order to limit the amount of overshoot. However, if FF trim is reduced too much, the load may not reach the desired temperature. If the load does not reach the desired temperature or is slow in the final stages, FF Trim can be increased: a maximum of 10% is suggested.

![Feed Forward View](image)

When attempting to control at very low temperatures it can become a problem to achieve stable control because of excessive power being supplied during heating. The available power can be limited using the power limit parameter OP.Hi, make a note of the original settings before adjusting. For power settings please refer to the fuse and power section at the back of the manual. If the parameter is normally set to 100%, try initially setting it to 50% to improve stability. Avoid settings below 40% where possible (though some furnaces require low settings for reasons unconnected with cascade control).
Power Limit View
4.3 Bypassing Cascade Control

This applies where the Control Thermocouple is a removal probe (e.g. in a tube furnace), or where for other reasons it may be required to operate the furnace or oven directly from the Element Loop.

To operate without Cascade Control the load thermocouple has to remain connected at all time; or a link has to be made across the thermocouple input connections.

4.4 3508P1 Element Loop (Loop 2)

In these circumstances the Element Controller is configured with the local/remote parameter, accessible in level 2 (Refer to instrument operating instructions).

To switch cascade control on or off. In Level 2, press Scroll until the display shows L-r.

Using the up ▲ down ▼ set:

– SP₂ = cascade control on
– SP₁ = cascade control off

The top left hand side of the screen will show SPX when SP₂ is enabled. The instrument operates as an independent Programmer/Controller when L-r is set to SP₁. To return to cascade control, change the L-r parameter to SP₂. Also note that cooling at low temperatures takes longer per degree than it does at high temperatures.

4.5 Caution

If the Load Thermocouple is removable, leave it in the furnace or oven chamber whenever possible. Operating with the Cascade Control active and with the Load Thermocouple in an unheated position (such as lying on the work bench) may cause the furnace or oven to heat up to its maximum temperature, wasting power and possibly shortening element life.

4.6 Over-Temperature Control

Where over-temperature control is fitted, it normally protects against failure of the control system or of a component such as a power control relay. The over-temperature controller must be set at a level higher than the greatest element temperature, typically 15 °C above maximum.

If the working temperature is less than the maximum temperature, then it may be possible to set the over-temperature limit as follows:

\[
\text{working temperature} + (\text{maximum temperature} \times \text{FF/100}) + 15 \degree C
\]

where FF is the Feed Forward percent parameter value (e.g. 10)

Example: for working at 800 °C in a 1200 °C product, the over-temperature limit could be set to 800+120+15=935.
5.0 2132 Over-Temperature Controller Description (if fitted)

5.1 Description

This over-temperature controller is fitted and supplied ready to use by Carbolite Gero. It is a digital instrument with a latching alarm, requiring no additional panel controls. The controller features easy setting of over-temperature setpoint and reading of current temperature by the over-temperature sensor.

5.2 Operation

5.2.1 Controls

Most Carbolite Gero products are fitted with an instrument switch which cuts off power to the controller and other parts of the control circuit.

To operate the controller, power must be supplied to the product and the instrument switch must be on. If a time switch is included in the product circuit, this must be in the 'ON' position.

When an over-temperature condition occurs, the controller cuts the power to a contactor, which in turn cuts power to the heating elements. Power is not restored until the controller is 'reset'.

Some components will operate after the over-temperature feature isolates the power supply e.g. cooling fans will continue to operate, provided that there is a power supply to the product. In some cases the product may not do so, if other options (such as a door switch) are fitted.
5.2.2 Operation

When switched on, the controller lights up, goes through a short test routine and then displays the measured temperature or the over-temperature setpoint.

The page key displays access to parameter lists within the controller.

A single press of the page key displays the temperature units, normally set to °C; further presses reveal the lists indicated in the navigation diagram. See section 5.4.

The scroll key allows access to the parameters within a list. Some parameters are display-only; others may be altered by the operator.

A single press of the scroll key in the 'Home' list displays the temperature units; further presses reveal the parameters in the current list indicated in the navigation diagram.

To return to the 'Home' list at any time, press page and scroll together, or wait for 45 seconds.

The down and up keys are used to alter the setpoint or other parameter values.

5.2.3 Over-Temperature Operation

Use down and up to alter the over-temperature setpoint. This should normally be set a little above the working temperature (for example 15 °C above). The product is supplied with the over-temperature set at 15 °C above the furnace or oven maximum working temperature.

Press scroll twice view the present temperature as measured by the over-temperature controller. Press it twice, the first press shows the temperature units (°C).

5.2.4 Over-Temperature Alarm

If an over-temperature condition occurs, the OP2 indicator flashes and an alarm message 2FSH also flashes, alternating with the setpoint. Power to the heating elements is disconnected.

5.2.5 Resetting the Over-Temperature Alarm

To acknowledge the alarm press scroll and page together.

If the alarm is acknowledged while there is still an over-temperature condition, the OP2 indicator stops flashing but continues to glow. The 2FSH alarm continues to flash until the over-temperature condition is cleared (by the temperature falling), when normal operation resumes.

If the alarm is acknowledged when the temperature has dropped (or after the over-temperature setpoint has been raised) so that the over-temperature condition no longer exists, then the furnace or oven immediately resumes normal operation.

5.2.6 Sensor Break

The over-temperature cut-out system also operates if the over-temperature control thermocouple breaks or becomes disconnected. The message S.br flashes where the measured temperature is normally displayed.
5.3 Audible Alarm

If an audible alarm is supplied for use with the over-temperature controller, it is normally configured to sound on over-temperature condition and to stop sounding when the alarm is acknowledged as given in section 5.2.

Note: the alarm may sound during controller start-up.

6.0 Operation

6.1 Operating Cycle

1. Plug the furnace in with the plug supplied.
2. Switch on the mains isolator.
3. The temperature controller will illuminate and start its test cycle.
4. Press "ON".
5. The "FURNACE ON" light will be on, and the furnace will start to heat up to the preset program in the Eurotherm 3508 to ISO 12981-1
6. The "GAS ON" light will be on, and gas will flow into the glass retort.
7. Set the flowmeter to 50 L/H.

8. Check the pressure gauge, and make adjustment if need.
9. After the temperature has reached 1000°C, the controller will dwell for 10 minutes.
10. After 10 minutes an alarm will sound for 10 seconds, and then stop.
11. The "SAMPLE IN" light will be flashing.
6.0 Operation

12. Load sample.

13. Press "SAMPLE IN".

14. The "SAMPLE IN" light will stop flashing, and stay on.
15. The furnace will dwell at 1000°C for 100 minutes, with gas as to the ISO12981-1.
16. After the dwell the "FURNACE ON" light will switch off.
17. The furnace will start to cool down for 30 minutes with the gas on.
18. After 30 minutes the alarm sounds for 10 seconds.
19. The gas will turn off.
20. The "SAMPLE OUT" light will be on.
21. Remove the inner retort, and place in the Retort Cooling Area.
22. Retort Cooling Area.

23. Press "ON" to reset for the next test.

### 6.2 General Operating Advice

Heating element life is shortened by overheating. Do not leave the product at high temperature when it is not required. The maximum temperature is shown on the product rating label and in section 12.0 towards the back of this manual.
Lightweight ceramic fibre insulation can easily be marked by accidental contact. Some fine cracks may develop in the surface of the insulation due to the progressive shrinkage of the insulation materials. Cracks are not usually detrimental to the functioning or the safety of the product.

6.3 Recovery of Glass Retort

If at any time the glass retort breaks within the heating chamber, or the test has to be stopped, the control has to be reset.

1. Press Page on the Eurotherm3508 Controller, until "PROGSTAT" is displayed.

2. Press Scroll until "STATUS" is displayed.
3. Press the arrow keys until "Reset" is displayed.

4. Wait, and allow the controller to reset; the display will then go back to normal.

5. If the glass retort breaks within the Retort Cooling Area:
   - Always disconnect power to the furnace prior to carrying out recovery of the glass retort.
   - Remove the front right panel.
   - Take care when removing the element chamber.

6. If the glass breaks within the element chamber:
   - Remove with vacuum cleaner.
6.4 Over-Temperature

Built within the control panel, there is an element over-temperature controller. This has been factory set and should not be adjusted.

The over temperature thermocouple is positioned within the element winding:
6.5 Adjustment of Reaction Time

1. Enter Security Level 2 in the main controller (pass code 9); see the Eurotherm 3508 Controller section of this manual.
2. Press the Page key until "Program Edit" is reached.
3. Press Scroll until the segment 6 dwell time is reached.
4. Adjust the dwell period to the calculated figure. The standard setting as supplied, is 1 hour 40 minutes.

6.6 Power Adjustment

The product control system incorporates electronic power limiting. The power limit parameter OP.Hi is accessible to the operator and can be used to adjust the product to the actual supply voltage.

Some models covered by this manual are fitted with 208 V elements and are designed for use over the range of voltages 200 V - 250 V; the power limit parameter is set accordingly. These models may be relocated to a different voltage within the range: the power limit should be reset to match the voltage.

To check whether the furnace is a 208 V model:

- look at the OP.Hi parameter
- make a note of the value and compare with the 11.0;
- observe the rating label; if a range of voltages is stated, it is not a 208 V multi voltage model;
- if in doubt, check with Carbolite Gero – each product has its own record card.

Refer to the controller instructions for how to change the power limit.
7.0 Maintenance

7.1 General Maintenance

Preventive rather than reactive maintenance is recommended. The type and frequency depends on the product use; the following are recommended.

7.2 Maintenance Schedule

CUSTOMER QUALIFIED PERSONNEL

DANGER! ELECTRIC SHOCK. Risk of fatal injury. Only electrically qualified personnel should attempt these maintenance procedures.

<table>

7.0 Maintenance

7.2.1 Cleaning
Soot deposits may form inside the furnace, depending on the process. At appropriate intervals remove these by heating as indicated in the General Operation Notes.

The product's outer surface may be cleaned with a damp cloth. Do not allow water to enter the interior of the case or chamber. Do not clean with organic solvents.

7.3 Calibration
After prolonged use, the controller and/or thermocouple may require recalibration. This is important for processes that require accurate temperature readings or for those that use the product close to its maximum temperature. A quick check using an independent thermocouple and temperature indicator should be made from time to time to determine whether full calibration is required. Carbolite Gero can supply these items.

Depending on the controller fitted, the controller instructions may contain calibration instructions.

7.4 After-Sales Service
Carbolite Gero Service has a team of Service Engineers who can offer repair, calibration and preventive maintenance of furnace and oven products both at the Carbolite Gero factory and at customers’ premises throughout the world. A telephone call or email often enables a fault to be diagnosed and the necessary parts to be despatched.

In all correspondence please quote the serial number and model type given on the rating label of the product. The serial number and model type are also given on the back of this manual when supplied with the product.

Carbolite Gero Service and Carbolite Gero contact information can be found on the back page of this manual.

7.5 Recommended Spare Parts and Spare Parts Kit
Carbolite Gero can supply individual spare parts or a kit of the items most likely to be required. Ordering a kit in advance can save time in the event of a breakdown.

Each kit consists of one thermocouple, one solid state relay and one heating element. When ordering spare parts please quote the model details as requested above.
8.0 Repairs and Replacements

8.1 Safety Warning - Disconnection from Power Supply

Immediately switch the product off in the event of unforeseen circumstances (e.g. large amount of smoke). Allow the product to return to room temperature before inspection.

Always ensure that the product is disconnected from the electrical supply before repair work is carried out.

Caution: Double pole/neutral fusing may be used in this product.

8.2 Safety Warning - Refractory Fibre Insulation

Insulation made from High Temperature Insulation Wool
Refractory Ceramic Fibre, better known as (Alumina silicate wool - ASW).

This product contains alumino silicate wool products in its thermal insulation. These materials may be in the form of blanket or felt, formed board or shapes, slab or loose fill wool.

Typical use does not result in any significant level of airborne dust from these materials, but much higher levels may be encountered during maintenance or repair.

Whilst there is no evidence of any long term health hazards, it is strongly recommended that safety precautions are taken whenever the materials are handled.

Exposure to fibre dust may cause respiratory disease.

When handling the material, always use approved respiratory protection equipment (RPE-eg. FFP3), eye protection, gloves and long sleeved clothing.

Avoid breaking up waste material. Dispose of waste in sealed containers.

After handling, rinse exposed skin with water before washing gently with soap (not detergent). Wash work clothing separately.

Before commencing any major repairs it is recommended to make reference to the European Association representing the High Temperature Insulation Wool industry (www.ecfia.eu).

Further information can be provided on request. Alternatively, Carbolite Gero Service can quote for any repairs to be carried out either on site or at the Carbolite Gero factory.

8.3 Temperature Controller Replacement

Refer to the controller instructions for more information on how to replace the temperature controller.
8.4 Thermocouple Replacement

Disconnect the product from the power supply. Remove terminal cover to gain access to the thermocouple connections. Make a note of the thermocouple connections.

Thermocouple cable colour codings are:

<table>
<thead>
<tr>
<th>Thermocouple leg</th>
<th>Colour</th>
</tr>
</thead>
<tbody>
<tr>
<td>positive (type K)</td>
<td>green</td>
</tr>
<tr>
<td>negative</td>
<td>white</td>
</tr>
</tbody>
</table>

Disconnect the thermocouple from its terminal block and withdraw the thermocouple from its sheath by bending the metal tag or releasing the screw to release. It is also advisable to remove the sheath and shake out any broken pieces of thermocouple. Re-assemble with a new thermocouple, observing the colour coding, ensuring that the thermocouple is not twisted as it is being inserted and that the metal tag is bent back to grip the sheath.

Refit the element access panel.

8.5 Solid-State Relay Replacement

Disconnect the product from the power supply and remove the appropriate cover as given above.

Make a note of the wire connections to the solid state relay and disconnect them. Remove the solid state relay from the base panel or aluminium plate. Replace and reconnect the solid state relay ensuring that the bottom of it has good thermal contact with the base panel or aluminium plate.

Refit the access panel.

8.6 Fuse Replacement

Fuses are marked on the wiring diagram with type codes, e.g. F1, F2. For more information on fuses refer to section 11.0.

*Depending on model and voltage, the different fuse types may or may not be fitted.*

If any fuse has failed, it is advisable for an electrician to check the internal circuits. Replace any failed fuses with the correct type. For safety reasons do not fit larger capacity fuses without first consulting Carbolite Gero.

The fuses are located at the cable entry point. Remove the back panel or control box back panel to gain access to the fuses.
8.7 Element Replacement

Individual elements are not available for this model of product, if an element fails then a complete element assembly is required. For details and fitting instructions contact Carbolite Gero Service, see the back page of this manual for contact information.
## 9.0 Fault Analysis

### A. Furnace Does Not Heat Up

<td>1-phase</td>
<td>200-240</td>
<td>6A</td>
</tr>
</tbody>
</table>

11.2 Power Settings

The power limit settings (parameter OP.Hi) for this model are voltage dependant. The figures represent the maximum percentage of time that controlled power is supplied to the elements. Do not attempt to “improve performance” by setting a value higher than the recommended values. To adjust the parameter refer to the "Changing the Maximum Output Power" of the control section of the manual.

<table>
<thead>
<tr>
<th>Volts</th>
<th>120 V</th>
<th>208 V</th>
<th>220 V</th>
<th>230 V</th>
<th>240 V</th>
</tr>
</thead>
<tbody>
<tr>
<td>Power (%)</td>
<td>-</td>

<td>1000</td>
<td>1.05</td>
<td>660 x 660 x 475</td>
<td>52</td>
</tr>
</tbody>
</table>

12.1 Environment

The models listed in this manual contains electrical parts and should be stored and used in indoor conditions as follows:

Temperature: 5 °C - 40 °C

Relative humidity: Maximum 80 % up to 31 °C decreasing linearly to 50 % at 40 °C
## Service Record
